DETAILED ACTION

1. This Office Action is a response to the remarks filed on November 20, 2009. Claims 1 and 9 have been amended; claims 10 and 11 have been added; no claims have been cancelled.
2. In view of the amendment(s), remarks and Declaration under 37 CFR 1.132, the rejection of claims 1-7 and 9 under 35 U.S.C. 103(a) as being unpatentable as obvious over Nosokawa et al. (EP 0 889 063 A1 or U. S. Patent 6,313,231) in view of Shimomura et al. (U. S. Patent 4,959,060) has been withdrawn.

Allowable Subject Matter

3. Claims 1-7 and 9-11 are allowed.
4. The following is examiner's statement of reasons for allowance: The present claims are allowable over the closest references: Nosokawa et al. (EP 0 889 063 A1 or U. S. Patent 6,313,231) and Shimomura et al. (U. S. Patent 4,959,060).

Nosokawa discloses a process for preparing of a super absorbent resin composition comprising the following components (A), (B) and (C), or components (A) and (D): (A) a super absorbent resin; (B) a metal compound containing at least one metal A selected from the group consisting of titanium and zirconium; (C) a chelating agent, and (D) a coordination compound in which component (C) is coordinated with metal (A) (abstract).

Nosokawa discloses that after the completion of the polymerization of acrylic acid in the presence of ethyl cellulose as a dispersant, aqueous solution of sodium

hydroxide, ion-exchanged water and potassium persulfate, the super absorbent resin was obtained (Synthesis examples 1-7, page 9, line 44 through page 11, line 15). Then the super absorbent resin (A) was put in a twin-cylinder kneader, and the metal compound (B) and the chelating agent (C) were added thereto in the adjusted amounts either in a powder form or by spraying an aqueous solution thereof. The mixture was thoroughly stirred to mix to obtain a super absorbent resin composition (Table 2, Examples 1-11, page 11, line 15 through page 12).

Nosokawa discloses preferred examples of the chelating agent as component (C) are ethylenediaminetetraacetic acid (EDTA), tripolyphosphoric acid, polyphosphoric acid, etc. or salts thereof (e.g., Na, K or ammonium salt) (page 5, line 57 through page 7, line 46). The chelating agent as component (C) is preferably used in an amount of 0.01 to 5 parts by weight, particularly 0.05 to 2 parts by weight, per 100 parts by weight of super absorbent resin as component (A), which is within the claimed range (page 7, lines 50-51).

Component (C) may be coordinated with metal A, and the compound (metal chelate compound) in which component (C) is coordinated with metal A is referred to component (D) (pages 7-8, the bridging paragraph).

Nosokawa discloses that if desired, the super absorbent resin composition can contain various additives, such as reducing agent, etc. which can be added in a total amount of not more than 50% by weight based on the total weight of super absorbent resin composition (page 8, lines 10-13).

Shimomura discloses that a body fluid-absorbing article such as, for example, a disposable diaper is provided with at least one absorbent member comprising 50 to 99% by weight of a fibrous material and 50 to 1% by weight of an absorbent polymer, which absorbent member contains at least one compound (A) selected from the group consisting of sulfur-containing reducing agents, antioxidants, and oxidizing agents.

By the action of the compound (A), the swelled gel of the absorbent polymer formed in consequence of absorption of body fluid is prevented from being deteriorated or decomposed by aging (abstract).

Shimomura discloses several examples of the method for the incorporation of the compound (A) in the body fluid-absorbent member, for example, (3) method which causes the compound (A) to be contained in layers in the absorbent member by spraying a solution or dispersion of the compound (A) on the absorbent polymer then drying the wet absorbent polymer, when necessary, thereby producing a composite having the compound (A) deposited on the absorbent polymer, and then having this composite interposed between at least two sheets of the fibrous material, etc. (col. 4, line 35 through col. 5, line 27).

These compounds (A) is desired to be contained in the body fluid absorbent member in an amount in the range of 0.05 to 20 parts by weight, preferably 0.1 to 10 parts by weight, based on 100 parts by weight of the absorbent polymer (col. 3, lines 48-52).

However, both references Nosokawa et al. and Shimomura et al. do not disclose or fairly suggest the claimed process for preparing a water-absorbent resin, wherein

said process comprises c) a reducing agent or an oxidizing agent to the polymerized water-containing gelated product in an amount of 0.001 to 2 parts by weight, based on 100 parts by weight of the α,β -unsaturated carboxylic acid, as per newly amended claims 1 and 9, and particularly a water-absorbent resin obtained by said process, wherein the water-absorbent resin has Yellow Index of 12 or less, after allowing to stand at 50°C and 90% relative humidity for 20 days as per claim 5. It is noted that the criticality the above mentioned weight ratio and unexpected and superior results in discoloration resistance of the water-absorbent resin were shown in filed Declaration under 37 CFR 1.132.

5. As of the date of this Notice of Allowability, the Examiner has not located or identified any reference that can be used singularly or in combination with another references including Nosokawa et al. and Shimomura et al. to render the present invention anticipated or obvious to one of ordinary skill in the art.

6. In the light of the above discussion, it is evident as to why the present claims are patentable over the prior art.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delay, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reason for Allowance".
